

**GOLD AND BASE METAL EXPLORATION STUDIES BASED ON
MINERALOGICAL AND GEOCHEMICAL CHARACTERISATION
OF STREAM SEDIMENTS FROM NORTH PAKISTAN**

Submitted by Liaqat Ali

To the University of Exeter – Camborne School of Mines

as a thesis for the Degree of Doctor of Philosophy by Research in
Earth Resources

June 2011

This thesis is available for Library use on the understanding that it is copyright material and that no quotation from the thesis may be published without proper acknowledgement.

I certify that all the material in this thesis which is not my own work has been identified and that no material has previously been submitted and approved for the award of a degree by this or any other university.

Acknowledgements

I sincerely thank my supervisors Dr Ben Williamson and Dr Charlie Moon, whose knowledge, continuous guidance and support made the project possible. I am also grateful to Prof Frances Wall and the CSM Trust for financial support in the critical last stages of my PhD, the International Office and all the staff of the CSM Laboratories: Gavyn Rollinson, Rob Fairhurst, Rob Fitzpatrick, Peter Frost, Steve Pendray, Fiona Thomas and Sharon Uren. Special thanks to Steve Pendray for his help in the preparation of intricate Au grain polished blocks and Gavyn Rollinson for valuable QEMSCAN[®] analysis.

The following are also thanked: the Director of the NCE in Geology and the HEC for financial support; Dr M. Tahir Shah for allowing me to carry out preliminary processing/analytical work, and all the staff of the Geochemistry Laboratory at the NCE in Geology, University of Peshawar; Dr Richard Patrick and Paul Lythgoe for undertaking the ICP-MS analyses at the University of Manchester; Dr Rob Chapman (University of Leeds) for a helpful review of Chapter 5; Mr Ashfaq (Project Director, Waziristan Copper Exploration Project) and Mohammad Ihsan Afridi for providing all possible information and geochemical data for North Pakistan; Mr Wazir Mohammad and all the laboratory staff at the Sarhad Development Authority, Peshawar, and Dr Mohammad Arif and Dr Kafayatullah for their assistance in the field.

Special thanks to my wife (Seema Anjum) and also my entire family, teachers and friends for their love, support, encouragement, patience and help at all stages of my PhD studies.

Abstract

North Pakistan represents a highly favourable area for a variety of mineral deposit types, including arc-related porphyry Cu, Au and Mo and arc and back-arc epithermal precious metal deposits (Sweatman et al., 1995; PMDC, 2001). However, few deposits have been discovered in the area, mainly due to its remote nature and inaccessibility, and because of a lack of exploration tools for high altitude terrains. From stream sediment sampling campaigns by local and international organizations, including a large dataset provided by the Pakistan Mineral Development Corporation (PMDC), a significant amount of geochemical data now exists for the region. This data has been incorporated into an Arc-GIS 9.2 database, along with stream catchment and geological information, and detail of all known areas of mineralisation. From this, spatial catchment maps together with multi-element geochemical associations have been studied to delineate areas showing anomalous values for Au and base metals. The two most prospective areas were found to be the Shyok Suture Zone and northern Kohistan, with the dominant control on mineralisation being structural rather than lithological. These areas were targeted for detailed stream sediment sampling and mineralogical and geochemical analysis. From studies of Au and Au pathfinder elements in different size fractions of the stream sediments and heavy mineral concentrates (HMC), the catchments of Teru, Asheriat and Pakora (in order of decreasing rank) were identified as most prospective.

Morphological and geochemical analyses of native Au grains from panned concentrates has given an indication of proximity to bedrock source (<10 km) and the possible styles of mineralisation in these catchments; porphyry Cu-type in Asheriat and Pb-Sb quartz veins in Teru and Pakora. Automated mineralogical analysis of the stream sediments (<180 μm fraction) and HMC (<180 μm), using a QEMSCAN[®] system, confirmed this interpretation. The effectiveness of the developed methodologies for exploration in remote and high altitude terrains of North Pakistan is discussed, and recommendations made for future exploration.

Table 5.1 Summary table of Au grain compositions from the Asheriat, Pakora, Teru, Bagrot, and Shoghor catchments	155
Table 5.2 Mineral inclusions in Au grains from the Asheriat, Pakora and Teru catchments, with host Au grain compositions.....	160
Table 6.1a Minerals identified in stream sediments from the Shoghor and Bagrot catchments using SEM-EDS (Khaliq, 1991)	180
Table 6.1b Mineralogy of stream sediment samples from the Asheriat, Teru and Pakora catchments, as determined from qualitative SEM-EDS studies (this study).....	181
Table 6.2 Wt. % of minerals in HMC (<180 µm) determined using QEMSCAN®	185
Table 6.3 Wt. % of key minerals in stream sediment samples (<180 µm fraction)	

determined using QEMSCAN®.....	188
Table 6.4 Mineralogy of HMC from different catchments (180-75 µm and <75 µm fractions) determined using QEMSCAN®	190
Table 6.5 Mineralogy of key minerals from stream sediments (180-75 µm and <75 µm fractions) determined using QEMSCAN®	191
Table 6.6 Mineral associations in samples from the Shoghor catchment determined using QEMSCAN®.....	192
Table 6.7 Mineral associations in samples from the Bagrot catchment determined using QEMSCAN®.....	198
Table 6.8 Mineral associations in samples from the Asheriat catchment determined using QEMSCAN®.....	201
Table 6.9 Mineral associations in samples from the Teru catchment determined using QEMSCAN®.....	204
Table 6.10 Mineral associations for grains from the Pakora catchment determined using QEMSCAN®.....	209
Table 6.11 Number of analytical points identified as ore-forming minerals in the HMC (<180 µm) and stream sediments (<180 µm) from QEMSCAN® analysis	214
Table 6.12 Diagnostic mineralogy of different styles of mineralisation (BCMEMP, 1995 and USGS, 1986, and references therein).....	215
Table 7.1 Summary of important metal associations in relation to lithology, as defined from the regional stream sediment geochemical database	225
Table 7.2 Comparison of important elemental associations in Asheriat, Teru and Pakora from the <75 µm dataset, HMC (Chapter 4) and regional dataset (Chapter 3) with geological units.....	227
Table 7.3 Summary table of Au grain morphological and geochemical characteristics	228
Table 7.4 Deposit model on the basis of mineral associations (derived from QEMSCAN® analysis) in HMC and stream sediments	232
Table 7.5 Data comparison table for Au chemistry and geochemical and mineralogical associations (QEMSCAN®).....	233
