# The biochemical consequences of ascorbate deficiency in *Arabidopsis thaliana*

A thesis submitted by Nighat Sultana for the degree of Doctor of Philosophy at  
the University of Exeter, College of Life and Environmental Sciences, School of  
Biosciences.

**December, 2011**

This thesis is available for Library use on the understanding that it is a copyright  
material and the no quotation from the thesis may be published without the proper  
acknowledgement.

I certify that all material in this thesis which is not my own work has been identified  
and that no material is included for which a degree has been previously approved  
from this or any other University

## Table of Contents

Acknowledgments.....	8
List of Figures.....	10
List of Tables.....	12
List of abbreviations.....	14
Abstract.....	15
Chapter 1: General Introduction.....	19
1.1 Introduction.....	19
1.2 Reactive oxygen species and oxidative stresses.....	20
1.3 ROS and their generation.....	21
1.4 Antioxidant system.....	24
1.5 AsA: an antioxidant.....	26
1.6 2-Oxoglutarate dependent dioxygenases (2-ODD).....	32
1.7 AsA biosynthesis: the D-mannose/L-galactose (D-Man/L-Gal) pathway.....	33
1.8 AsA-deficient mutants ( <i>vtc</i> ) of <i>Arabidopsis thaliana</i> .....	36
1.9 <i>Arabidopsis thaliana</i> : a model system.....	37
1.10 Aims of thesis.....	39
Chapter 2: Experimental Method.....	41
2. 1 Plant Material.....	41
2. 2 Growth and maintenance of seeds.....	41
2.2. 1 Surface sterilisation and plant growth.....	41
2.2. 2 Sowing seeds on soil and growth room conditions.....	42
2.2.3 Harvesting and storage of seeds.....	42
2.2.3.1 Tissue harvesting.....	42
2.2.3.1 Seed collection.....	43
2. 3 Metabolite extractions and assays.....	43
2.3. 1 Inactivation of the metabolic pathways.....	43
2.3. 2 Ascorbate assay.....	43
2.3. 3 Metabolite extraction and analysis from whole leaf.....	45
2.3. 4 Glucose-6-P assay (an extracellular marker).....	46
2.3. 5 Extraction of hormones and flavonoids.....	47

2. 4 Mass Spectrometry method development.....	47
2.4. 1 Development and optimisation of method for hormone and flavonoid analysis.....	47
2. 5 Plants stress treatments.....	49
2.5. 1 Optimisation of growth chamber conditions for high light stress experiments.....	49
2.5.2 Mechanical wounding.....	50
2.5.3 Salt stress treatment.....	50
2. 6 Proteomic analysis.....	51
2.6.1 Ionically-bound cell wall protein extraction.....	51
2.6. 2 Total protein assay.....	52
2.6.3 Peroxidase assay.....	52
2.6. 4 Lectin affinity chromatography.....	53
2.6. 5 Tryptic Digestion.....	53
2.6. 6 Proteins analysis by HPLC-Chip.....	54
2. 7 Statistical Analyses.....	55
Chapter 3: Metabolite Profiling of <i>Arabidopsis thaliana vtc</i> mutants.....	57
3. 1 Introduction.....	57
3. 2 Analytical techniques.....	60
3.2. 1 High Performance Liquid Chromatography-Mass Spectrometry (LC-MS).....	60
3.2. 2 Electrospray Ionisation.....	62
3.2. 3 Analyser.....	64
3.2. 4 Detector.....	65
3. 3 Untargeted Metabolites Analysis by LC-MS.....	68
3. 4 Material and Methods.....	69
3.4. 1 Compound deconvolution and alignment.....	70
3.4. 2 Noise filtering and Analysis of Variance.....	74
3. 5 Metabolite Identification.....	76
3.5. 1 Visualisation of the raw data.....	76
3.5. 2 Generation of Molecular Formulae and Database Searches.....	77
3. 6 Results.....	82

3.6. 1 Ascorbate concentration in the apoplastic fluid.....	82
3.6. 2 Metabolite profiling.....	84
3.6.2. 1 Total ion Chromatogram (TIC).....	84
3.6.2. 2 Deconvolution and Alignment.....	88
3.6.2. 3 Hierarchical Clustering Analysis (HCA).....	91
3.6.2. 4 Profile plot.....	100
3.6. 3 Metabolite Identification.....	103
3.6.3. 1 Identification of selected metabolites differentially expressed between WT and <i>vtc</i> mutants.....	103
3.6.3.2 Other metabolites affected by ascorbate deficiency.....	114
3. 7 Discussion.....	125
3.7. 1 Identification of compounds differentially expressed between WT and <i>vtc</i> mutants.....	127
3. 8 Conclusions.....	132
Chapter 4: Response of flavonoids and hormones to abiotic stress in <i>Arabidopsis</i> <i>thaliana</i> ascorbate-deficient mutants.....	135
4.1 Introduction.....	135
4. 2 Plant hormones and their role in stress response.....	137
4.2. 1 Abscisic acid (ABA).....	137
4.2. 2 Jasmonic acid (JA).....	139
4.2. 3 Salicylic acid (SA).....	141
4. 3 Plant Secondary Metabolites.....	142
4.3.1 Phenolic metabolites.....	143
4.3. 2 Flavonoids.....	144
4.3.2.1 Anthocyanins.....	146
4.3.2.2 Flavonols.....	147
4. 4 Methods.....	153

## Acknowledgments

I wish to express my deepest gratitude to my supervisor Professor Nicholas Smirnoff for his kind and benevolent supervision. I would like to say thanks to my second supervisor Professor Murray Grant for his valuable advice at all stages of my PhD. I am greatly indebted to Hannah Florance for mass spectrometry assistance and marvellous help and support especially at write-up phase. Sincere thanks to Venura Perera for his inventive support in my data analysis and for facilitating with alignment tools. Huge thanks goes to Mike Page and Deborah Salmon for their marvellous support at write-up phase. Big thanks to all other colleagues from the Mezzanine lab for their kind advice and providing pleasant working atmosphere which made my stay easy in the UK. I offer special thanks to the Grant group, especially Marta and Paul for their help in biotic stress experiments and for providing the opportunity to grow plants in their growth room. I wish to thank the IT people, Jonathan Barnes and Robin Batten, for their kind support. Contribution from all of you was vital for the success of this study.

I would like to thank Hazara University Mansehra and the Higher Education Commission, Pakistan (HEC) for funding. Sincere thanks to Dr Mukhtiar Hassan, Chairman of department of Biochemistry at Hazara University for his kind support and encouragement. I would like to thank all my friends for their support and encouragement during difficult time of my life. Last but not least, my warmest and dearest thanks to my all family especially my mother and elder brother Dr Ajmal Khalil for their confidence in me and for being always so supportive.

## **Dedication**

I would like to dedicate this thesis to my mother whose wonderful support and encouragement enabled me to complete my task successfully Alhamdulillah.

## List of abbreviations

AsA	Ascorbic acid
NADPH	Nicotinamide adenine dinucleotide phosphate (reduced form)
JA	Jasmonic acid
SA	Salicylic acid
ABA	Abscic acid
Prx	Peroxidase
AOX	Ascorbate oxidase
CW	Cell wall
<i>vtc</i>	Ascorbate deficient mutants
LC-MS	Liquid chromatography mass spectrometry
ESI	Electrospray ionisation
CE	Collision Energy
FW	Fresh weight
TIC	Total ion chromatogram
EIC	Extracted ion chromatogram
<i>m/z</i>	Mass to charge ratio
Rt	Retention time
KMPA	Kernal mass peak algorithm
HL	High light
LL	Low light
NCED	9-cis-epoxycarotenoid dioxygenase
F3H	Flavanone 3-hydroxylase
FLS	Flavonol synthase
LDOX	Leucoanthocyanidin dioxygenase

## Abstract

Biochemical consequences of ascorbate deficiency were studied in the leaf tissue of *Arabidopsis thaliana* ascorbate-deficient *vtc* mutants with a view of understanding the relationship between ascorbate, stress response and metabolism. Ascorbate is an important antioxidant and is also a cofactor for 2-oxoglutarate-dependent dioxygenases, which are involved in the biosynthesis of a number of metabolites. The response of wild type (Col-0) and *vtc1*, *vtc2-1*, *vtc2-2* and *vtc3-1* mutants to high light intensity, wounding and salinity was investigated using a metabolomics and proteomics approach. Metabolite profiling and comparative proteomics were performed by liquid chromatography-quadrupole time of flight mass spectrometry (LC-QToF MS) and targeted analysis of plant hormones and flavonoids by liquid chromatography triple-quadrupole mass spectrometry (LC-QQQ-MS). These combined analyses revealed the effect of ascorbate deficiency and stress on metabolites and cell wall proteins.

LC-QToF-MS based untargeted metabolite profiling methodologies were developed for analysis of metabolites on a large scale. Using this method about 3000-5000 metabolites (mass-retention time pairs) could be reproducibly detected in *A. thaliana* leaf extract and aligned between samples. Approximately 1000 metabolites were differentially expressed between WT and *vtc* mutants in different experiments. Of these, twenty eight compounds were confirmed to be differentially expressed by LC-QQQ-MS between WT and *vtc* mutants, and eight of these compounds were positively identified and validated with standards.

The plant hormones abscisic acid (ABA), salicylic acid (SA) and jasmonic acid (JA) have all been implicated in plant stress responses and differences in their accumulation in some of the *vtc* mutants have been reported. A systematic study of the response to stress of these hormones in several *vtc* mutants was carried out using LC- QQQ- MS. While some of the mutants showed increased SA and SA-glycoside accumulation, stress-induced ABA and JA accumulation was generally unaffected. Methods for identifying the metabolites in a targeted manner by LC- QQQ-MS was developed and were shown that all *vtc* mutants were impaired in the accumulation of anthocyanin in response to HL treatment. In strong contrast to anthocyanin, flavonol glycosides were not affected by ascorbate deficiency. Therefore, ascorbate deficiency has a specific effect on the anthocyanin biosynthesis.

Ascorbate occurs in the plant cell wall and isolation of apoplastic fluid showed that all *vtc* mutants have decreased apoplastic ascorbate compared to WT. Ionically-bound proteins were from the cell wall of *A. thaliana* leaves. Peroxidase specific activity in this fraction tended to be higher in *vtc* mutants than WT. High light intensity also increased peroxidase activity in WT and *vtc* mutants. To determine which peroxidase isoenzyme caused increased peroxidase activity, ionically-bound cell wall N-glycosylated proteins were isolated by Concanavalin A chromatography and analysed by LC-QToF-MS. Comparison of WT and *vtc2-2* grown in low light and high light identified 937 peptides significantly different between WT and *vtc2-2* and some are also affected by light intensity. Specifically, peroxidases 33 and 34 had increased abundance in *vtc2-2*.

The results show that ascorbate deficiency causes a detectable change in the metabolome of *A. thaliana* leaves, with specific effects on anthocyanin accumulation being detected. Ascorbate deficiency also influences the expression of cell wall proteins. Peroxidase activity is increased, and this response could be related to the increased pathogen resistance reported in *vtc* mutants.
