

# **Experimental investigation of social learning in domestic animals and non-human primates.**

Submitted by Nicole R. Dorey to the University of Exeter as a thesis for the degree of Doctor of Philosophy in Animal Behaviour in the faculty of science, June 2008.

This thesis is available for library use on the understanding that it is copyright material and that no quotations from the thesis may be published without proper acknowledgement.

I certify that all material in this thesis which is not my own work has been identified and that no material is included for which a degree has previously been conferred upon me.

Nicole R. Dorey

## Abstract

Imitation is considered to be an efficient method of conveying information between individuals. It is believed to be among the least common and most complex forms of animal learning. After almost a century of studying social learning in animals, scientists still have not been able to give a clear answer to the question “Do animals imitate?”. Although there have been some studies that have shown certain species under certain conditions unequivocally imitate (e.g. Zentall, et al., 1996), these studies have not been successfully replicated in a wide range of species. This thesis expands the social learning literature extending the range of settings and species in which it has been studied and by drawing links to the field of behaviour analysis.

Four of the current studies used versions of the two-action method to look for imitative learning in both non-human primates and domesticated animals. In this methodology an observer watches a demonstrator manipulate an apparatus with two different parts of their body. Using two different parts of the body and not two different manipulations lets researchers determine if the individual is learning by observation or just learning about changes in the state of the environment. This methodology is the only one that can distinguish local enhancement (learning only to attend to the location of the demonstrator), or stimulus enhancement (learning only to attend to the stimulus which the demonstrator interacts with) from “true” imitation (Campbell, Heyes, and Goldsmith, 1999).

One of the current studies used the “do as I do” methodology. In this method a subject is trained to match a few gestures of the demonstrator for reinforcement (i.e. the demonstrator raises her/his hand and the subject raises his/her hand) on the verbal command of “Do this” or “Do it”. After the subject reaches criterion on the trained

behaviours a novel behaviour is added that has not been trained to see if the subject will spontaneously imitate the behaviour. Successfully copying a novel demonstration is taken as evidence of understanding the rule needed for imitative performance. This methodology is popular because it not only can distinguish between imitation and the other forms of social learning, but it can also show the subjects' ability to generalize this type of learning.

The overall results show very little imitative learning occurring in the various groups of animals studied. The low rate of imitation may not be surprising. For just over 100 years psychologists have been studying social learning and in that time only a handful of researchers have been able to show clear evidence of an animal's ability to imitate the actions of a demonstrator. These results suggest that, though imitative learning may be important in the lives of a few species, or in the acquisition of particular behaviour, it is unlikely that it plays an essential role in the acquisition of behaviour in general, especially behaviour through which animals directly manipulate their environment.

## Table of Contents

<b>List of Figures</b> .....	<b>6</b>
<b>List of Tables</b> .....	<b>8</b>
<b>Author's Declaration</b> .....	<b>10</b>
<b>Acknowledgements</b> .....	<b>13</b>

### Chapter One:

<b>1.1 Social learning from Psychological and Biological perspectives</b> .....	<b>18</b>
<b>1.2 Distinguishing imitation from other forms of social learning</b> .....	<b>18</b>
<b>1.3 Why imitation</b> .....	<b>21</b>
<b>1.4 Methodology</b> .....	<b>22</b>
1.4.1 Two-Action Method.....	<b>23</b>
1.4.1.1 Bidirectional control.....	<b>25</b>
1.4.1.2 Standard Two-Action.....	<b>28</b>
1.4.2 Do as I Do.....	<b>30</b>
1.4.2.1 Do as I Do with Humans.....	<b>31</b>
1.4.2.2. Do as I Do with Non-humans animals.....	<b>32</b>
<b>1.5 Location</b> .....	<b>38</b>
<b>1.6 Subjects</b> .....	<b>42</b>
1.6.1 Primates.....	<b>42</b>
1.6.2 Domesticated animals.....	<b>49</b>
<b>1.7 Discussion</b> .....	<b>51</b>

### Primates:

#### **Chapter Two: Diana and Macaque monkeys**.....**55**

2.1 Introduction.....	<b>55</b>
2.2 Method.....	<b>58</b>
2.3 Results.....	<b>62</b>
2.4 Second Experiment.....	<b>66</b>
2.5 Discussion.....	<b>69</b>

#### **Chapter Three: Goeldi's monkey**.....**73**

3.1 Introduction.....	<b>73</b>
3.2 Method.....	<b>76</b>
3.3 Results.....	<b>81</b>
3.4 Discussion.....	<b>84</b>

### Domesticated animals:

<b>Chapter Four: Dogs</b> .....	<b>88</b>
4.1 Introduction.....	<b>88</b>
4.2 Experiment 1.....	<b>93</b>
4.2.1 Method.....	<b>93</b>
4.2.2 Results/ Discussion.....	<b>96</b>
4.3 Experiment 2.....	<b>101</b>
4.3.1 Method.....	<b>102</b>
4.3.2 Results.....	<b>106</b>
4.4 Overall Discussion.....	<b>109</b>
<b>Chapter Five: Camels</b> .....	<b>112</b>
5.1 Introduction.....	<b>112</b>

## List of Figures

### Chapter 2

Figure 2.1: An illustration of a console used. The five manipulanda the demonstrator was trained to manipulate are labelled.....62

### Chapter 4

Figure 4.1: Shows the break down of the observers' response during baseline, what behaviour they were shown by the demonstrators and their responses after watching the demonstration.....97

Figure 4.2: Shows proportion of responses of each type made each demonstration condition.....98

Figure 4.3: Pictures on the top show the demonstrator pressing the pedal down with his nose and the observer dog (Cholmodley), pressing the lever down with his nose (although the behaviour doesn't match exactly). Pictures on the bottom show demonstrator performing paw push and Tessa pushing the pedal with her paw after seeing the demonstrator.....100

Figure 4.4: Shows a diagram of the demonstrator dog opening the door with her paw as the observer dog watching the demonstration. ....105

Figure 4.5: Shows the number of observers making responses after watching either a familiar human demonstrator, an unfamiliar human demonstrator, a familiar dog demonstrator, or an unfamiliar dog demonstrator.....107

Figure 4.6: Shows proportion of responses of each type made for the control (no demonstration) condition and each of two demonstration conditions (nose and paw) ...109

### Chapter 5

Figure 5.1: Shows a diagram of the experiment all set up. The experimenter was behind the chain link fence while the nose and hoof targets were assessable to the camel.....116

Figure 5.2: Shows the rate of responding per session for Carmel, Oscar and Alice for their trained behaviour. It also shows James' responding during the experiment (before his training) towards the targets available. Note that James was present for every demonstration. Vertical lines show the transition from baseline to training.....121

### Chapter 6

Figure 6.1: The percent correct across sessions for all the behaviours trained in phase one. The vertical lines indicate the phase change between baseline and training and the gaps

indicate sessions when the behaviour was not modelled, not all behaviours could be modelled in all sessions because of time constraints.....142

Figure 6.2: Shows the percent correct across session for all the behaviours trained in phase two. The vertical lines indicate the phase change between baseline and training and the gaps indicate sessions when the behaviour was not modelled, not all behaviours could be modelled in all sessions because of time constraints.....143

## **Chapter 7**

Figure 7.1: Reproduced graph from Vokel and Huber, 2000. “Number of observers that opened the canisters at least once by hand (hand opening) or by mouth (mouth opening) during the first test session. Six observers saw a mouth-opening demonstrator (group mouth) and five saw a hand-opening demonstrator (group Hand). \*  $P < 0.05$ .”. (p 199)  
.....154

## List of Tables

### Chapter 2

Table 2.1: List of behaviours, description of picture commands and part of body trained...  
.....60

Table 2.2: Number of times the Diana monkey, Akea, imitated the demonstrator; performed the appropriate behaviour with the correct body part and the incorrect behavior with the wrong body part immediately (20 sec.) after the demonstrator performed the behaviour. It also shows the number of times the demonstrator performed the behaviour in the presence of the observer, the number of times the next one to respond was the observer and of the responses the number of times those responses were to other cues. The other Diana monkey showed no imitative learning.....63

Table 2.3: Number of times the Sulawesi black crested macaques, Douglas and Aspen imitated the demonstrator, performed the appropriate behaviour with the correct body part immediately (30 sec) after the demonstrator performed the behaviour. It also shows the number of times the demonstrator performed the behaviour in the presence of the observer, the number of times the next one to respond was the observer and of the responses the number of times those responses were to other cues. The other Sulawesi black crested macaques (N=8) showed no imitative learning.....65

### Chapter 3

Table 3.1: The number of sessions given, and the stimuli available, at each stage of the experiment. ....79

Table 3.2: Summarizes the rates of responding per minute (number of responses for the entire experiment divided by the total number of sessions that the target was available and by the session length (10)) made by each subject to all targets, during the entire experiment according to the response categories. Numbers in parenthesis are the total number of responses made by that subject. ....83

### Chapter 4

Table 4.1: This table shows a summary of the dogs used as observers. It includes their names, breed type and age.....94

Table 4.2: This table shows a summary of the dogs used as observers and ones used in the control condition. It includes their names, breed type and age (rounded to the nearest month).....104

## **Chapter 5**

Table 5.1: Shows the targets assigned to each of the older members in the group and the targets used as controls.....**118**

Table 5.2: The sessions each subject could participate in, and the stimuli available, at each stage of the experiment. ....**119**

Table 5.3: Responses averaged across all sessions in which they were available. Where a given class of response could be made to more than one stimulus, rates to the different stimuli (reinforced targets for other camels) are added, and rates of the unassigned stimulus (not reinforced for any camel) are shown. The final columns shows which response(s) by Carmel would fit each category, as an example. ....**126**

Table 5.4: Rates of responding per minute across all sessions in which they were available for James.....**128**

## **Chapter 6**

Table 6.1: The number of trials for each behaviour after training for the entire experiment in the order they were trained for both phase one and phase two .....**139**

Table 6.2: Shows the percent hits and false positives for each behaviour, averaged across all sessions after training had begun with the relevant command. The behaviours are listed in the order in which they were trained. Only the first response made after a command was counted.....**140**

## **Chapter 7**

Table 7.1: Reproduction of table from Voelkl and Huber (2000). “The total numbers of nose-near-lid approaches, mouth-opening and hand-opening actions and opened canisters and the discrimination ratio (the number of hand-opened canisters divided by the total number of opened canisters) are shown for session 1. For session 2 only the total number of opened canisters is shown, as all canisters were opened by mouth. For the non-exposed control group (N=11) only the mean values are shown” (p 199).....**153**

## **STATEMENT OF THE CANDIDATE’S CONTRIBUTION TO CO-AUTHORED PAPERS**

There are five studies included in this thesis, all of which have been written up as manuscripts for publication. As detailed below, the substantial contribution to the co-authored papers presented in this thesis was made by the candidate. However, while the candidate is fully responsible for the work presented in this thesis, where the first person is used it is in the plural (i.e., ‘we’ rather than ‘I’) as in the original peer-reviewed articles to reflect the collaborative efforts guiding the research process. All chapters that have been written up as manuscripts are presented in the format requested by the respective journal; since each manuscript is meant to stand alone, some information may be redundant.

**Paper 1:** Chapter 2

Dorey, N.R., Melfi, V. and Lea, S.E.G. (in prep). **Evidence of social learning in Diana monkeys and Sulawesi black crested macaque**

The first manuscript, presented in this thesis as Chapter 2, was submitted as a paper to the *Journal of Applied Animal Behaviour Science*. The paper came back rejected, because it didn’t fit into the aim of the journal, but the reviewers gave great suggestions and thus the chapter was corrected. The chapter has been reformatted and is being sent to *Animal Cognition*. The data were collected and analysed by the candidate, with statistical advice from Prof. Stephen Lea. The paper was written with supervisory support from Prof. Stephen Lea and Dr. Vicky Melfi.

**Paper 2:** Chapter 3

Dorey, N.R., Melfi, V. and Lea, S.E.G. **No evidence of imitative learning in a callitrichine, Goeldi's monkey (*Callimico goeldii*)**

The second manuscript, presented in Chapter 3, was sent to the *Journal of Comparative Psychology*. It came back rejected, because the methodologies did not match that of previously published work. However the reviewers gave fantastic feedback and thus the manuscript was changed accordingly. The candidate designed the methodology of data collection as well as collected and analysed the data. Prof. Stephen Lea contributed to the analysis of the data. The paper was written with supervisory support from Prof. Stephen Lea and Dr. Vicky Melfi.

**Paper 3:** Chapter 4

Dorey, N.R., Lea, S.E.G., & Melfi, V. (in prep.). **Indication of imitative learning from conspecifics in a dog (*Canis familiaris*).**

The third manuscript, presented in Chapter 4, was sent to Dr. Clive Wynne for review, who gave some very useful comments. The candidate designed the methodology of data collection as well as collected and analysed the data. Prof. Stephen Lea contributed to the analysis of the data. The paper was written with supervisory support from Prof. Stephen Lea and Dr. Vicky Melfi.

**STATEMENT OF THE SUPERVISORS' CONTRIBUTION TO  
CO-AUTHORED PAPERS**

As outlined in the candidate's statement above, the substantial contribution to the co-authored papers presented in this thesis was made by the candidate. This includes the review of the literature presented in each paper, study design, statistical analyses and interpretation of the data, together with the write-up for publication. The supervisors contributed to the papers by advising on statistical analyses and interpretational issues, relevant literature, and writing style. Moreover, the theoretical framing of the empirical work in this thesis and the arrangement of the papers is a product of a concerted discussion of the thesis content between the candidate and supervisors.

Prof. Stephen E.G. Lea (first supervisor)

Dr. Vicky Melfi (second supervisor)

## Acknowledgments

I'm forever grateful to my supervisor Dr. Stephen E.G. Lea for all his advice, criticism, and support throughout the entire thesis. I always enjoyed our meetings, from sitting in the office to talking across the pond via webcam, they were the time we could bat ideas around and perfect the research and the writing (which is where I needed the most help ☺). I know that without his patience, meticulous teaching and constant encouragement I would not have gotten this far. Thank you from the bottom of my heart.

I'm copiously thankful to Dr. Vicky Melfi for her support and suggestions to the manuscript. I'm grateful she believed in me from the beginning, without her support and determination for my research it might not have taken place at the zoo. I enjoyed our 'working' dinners around her place and the late night chats we had to complete this thesis. I can't thank her enough for the time she took to painstakingly go through and help me with the writing of the manuscript. I have learned so much from her and for that I'm eternally grateful!

I would like to thank my fellow students. Being a graduate student can be a lonely time, however I was lucky to have Faith Warner. I would like to thank her for her perpetual friendship and companionship. I was truly lucky to have her enter the program at the same time. We went through a lot together; from taking a year of classes to getting lost at the zoo (on more than one occasion), it was always fun and I wouldn't want to do go through this with anyone else ☺ I look forward to a long lasting friendship! Ivonne Hoeger, the other

American, was also someone I was lucky to have met. It was nice to have a lunch buddy for the times I was working hard in my office at the Uni. No matter how long it has been since our last conversation we always pick up where we left off. Thank you for always being around when I needed you. I would like to thank my officemates (Kirsten, Lucy and Holly) for lending an ear when I needed one.

I would like to thank the Paignton zoo staff for all of their support, help, time out of their busy schedules and friendship. It could not have done it without them. They all were truly wonderful from the full fledged American parties to teaching me about the culture (especially what not to say). I would personally like to thank Julian Chapman, Nicky Jago, Lisa Doran, Jim Dicks, Christopher Bowers, Tony Dobbs (DIY Tony) and Andy Fry.

I still remember my first day entering the Science department at Paignton zoo. I was scared, excited, motivated and didn't know what to expect. I meet with the department for lunch and spoke to them about the research I wanted to do. It took a few more meetings before they trusted me and allowed me to start my research. However, I would have never in a million years, thought that in the end I would walk away with such an incredible experience, a wealth of knowledge of zoo research in areas outside of my Ph.D. and a strong, lasting friendship and fabulous colleagues. I'm extremely lucky to have been able to conduct this research under a team of brilliant people. I would like to thank Dr. Amy Plowman for her kindness and help with the research and for making me feel like part of the group. I'm forever grateful. A special thanks to Holly Farmer for always making me laugh and letting me borrow her desk/computer; Kathy Knight for her friendship. I had a great time working with her and learning new methodologies; Dr. Vicky Melfi who was my

biggest supporter and allowed me to dabble in areas outside of my research. I enjoyed working with her and will continue to use the knowledge I gained from her for a lifetime☺; Dr. Kirsten Pullen kept my head above water many many times. I thank her for her undying friendship. For without her, life in England just wouldn't have been as fun ☺ I would personally like to thank her for always being the one I can turn to at all hours of the night and early morning, for the nights of wine and Dr. Who, for making me just a little more British and a little less American (even if it took me a while to adjust when I went back home) and for giving me so many memories of England that I will cherish for the rest of my life.

Toward the end of my time in Exeter Michael had to head back to the states because his visa would not allow him to stay any longer When this happened I no longer felt safe living in the shared house we occupied and began looking for a place to live that would allow a dog. I looked for months but to no avail. It was Nicky Jago who came to my rescue and I am forever in her debt. Her hospitality and kindness was above and beyond and without it Zoë and I might have been living in a box by the sea. I would also like to thank Kate Jackson who allowed me to stay in her room whilst she was in Africa and for being a super cool flatmate when she came back. We all had many fun and interesting nights in the flat together. From the interesting neighbours to the mysterious wet spots it was always an adventure in the Merrit Flat. Thanks girls!

I thank my family for without them I would not be where I am today. They have always been supportive even when it meant an extra 7 years of school instead of getting a job ☺ It was uplifting to get packages from home and gave me the motivation to continue. I would

like to thank my brother for always thinking about me and sending me holiday trinkets and funny emails; My sister for giving me the strength to continue and for reminding me that I will finish and come back home sooner than later; My parents, for their undying love, encouragement and support even when they didn't fully understand.

I truly saved the best for last. It gives me great pleasure to express my deepest gratitude to Michael Dattolico. The love of my life, my best friend, and the man I can't wait to spend the rest of my life with. Without his support and encouragement I can honestly say I wouldn't have made it this far. He didn't think it was crazy to sell everything we owned and move to another country so that I can fulfil my dream and further my career. He never once questioned why I wanted a Ph.D. even though throughout the process I questioned it many times. He was always there for me, a shoulder to cry on, a person to talk with and a friend to travel and learn about the many cultures we came across along the way. I am forever thankful to have him in my life and honoured that he chose me to grow old with. *Ti amo di qui a eternity.*
