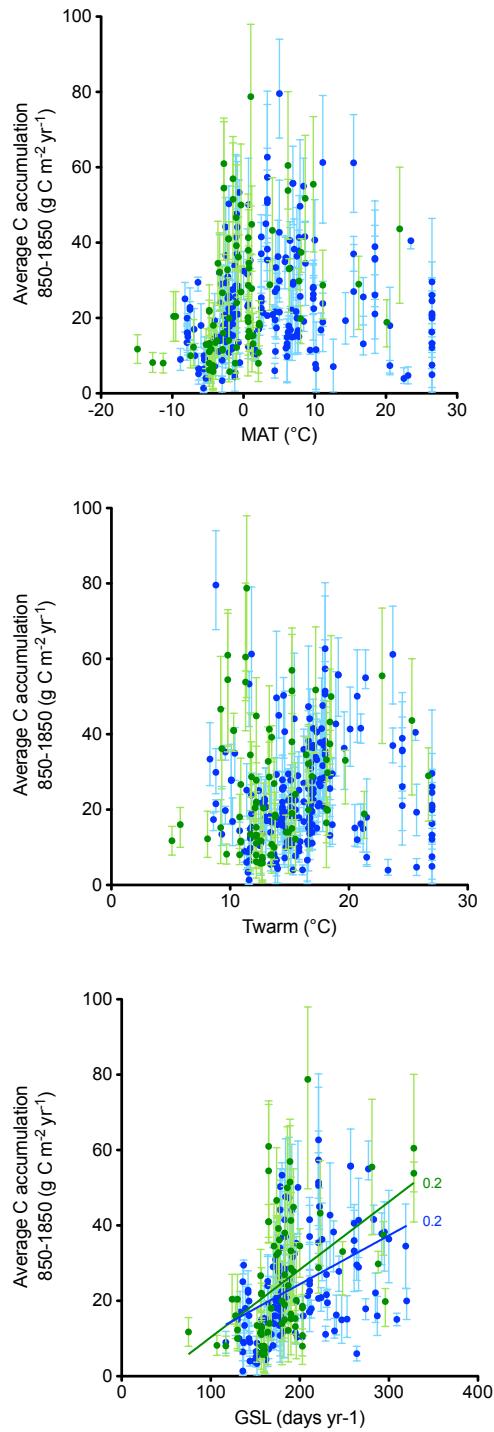

Figure SI1: Climate controls on the carbon accumulation rate for bogs (blue) and fens (green). The average yearly accumulation over the last millennium at each site compared to: a) mean annual temperature ($^{\circ}\text{C}$) b) mean temperature of the warmest month ($^{\circ}\text{C}$) and c) growing season length (days yr^{-1}). Note that for c) the sites with $\text{GSL}=365$ have been omitted, and the best fitting line for the remaining fens and bogs separately is shown in the diagram (R^2 next to the line).

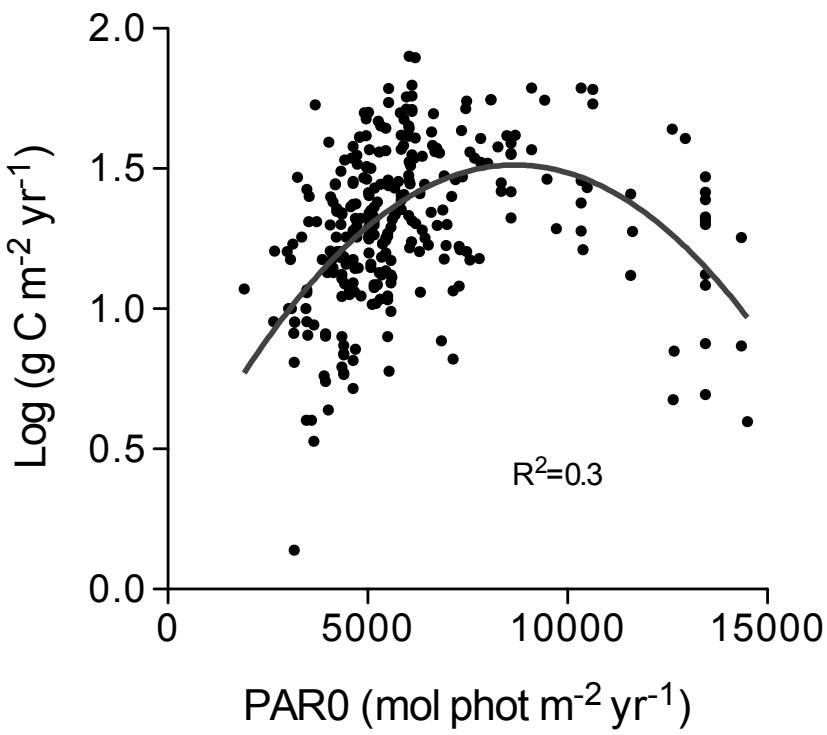

Figure SI2: Binomial relationship between PAR0 and the logarithm of the carbon accumulation rate used in the spatial analysis of the data. The best fitting line is shown in the diagram (R^2 next to the line).

Table SI2: Statistical significance of the regression model of carbon accumulation vs. PAR0 when tested against the null model. Model tested are those containing: a) all sites, where the carbon accumulation data has not been transformed; b) all sites, where the carbon accumulation data has been log transformed; c) only fen sites included, carbon accumulation data has been log transformed; and finally d) only bog sites included, carbon accumulation has been log transformed.

Model	R ²	F-stat	d.f.1	d.f.2	p-value
a. All: Quadratic no log transform	0.2123	39.34	2	292	7.439x10 ⁻¹⁶
b. All: Quadratic log transform	0.2526	49.35	2	292	2.572x10 ⁻¹⁹
c. Fen: Quadratic log transform	0.2792	13.95	2	72	7.591x10 ⁻⁶
d. Bog: Quadratic log transform	0.2437	33.84	2	210	1.823x10 ⁻¹³

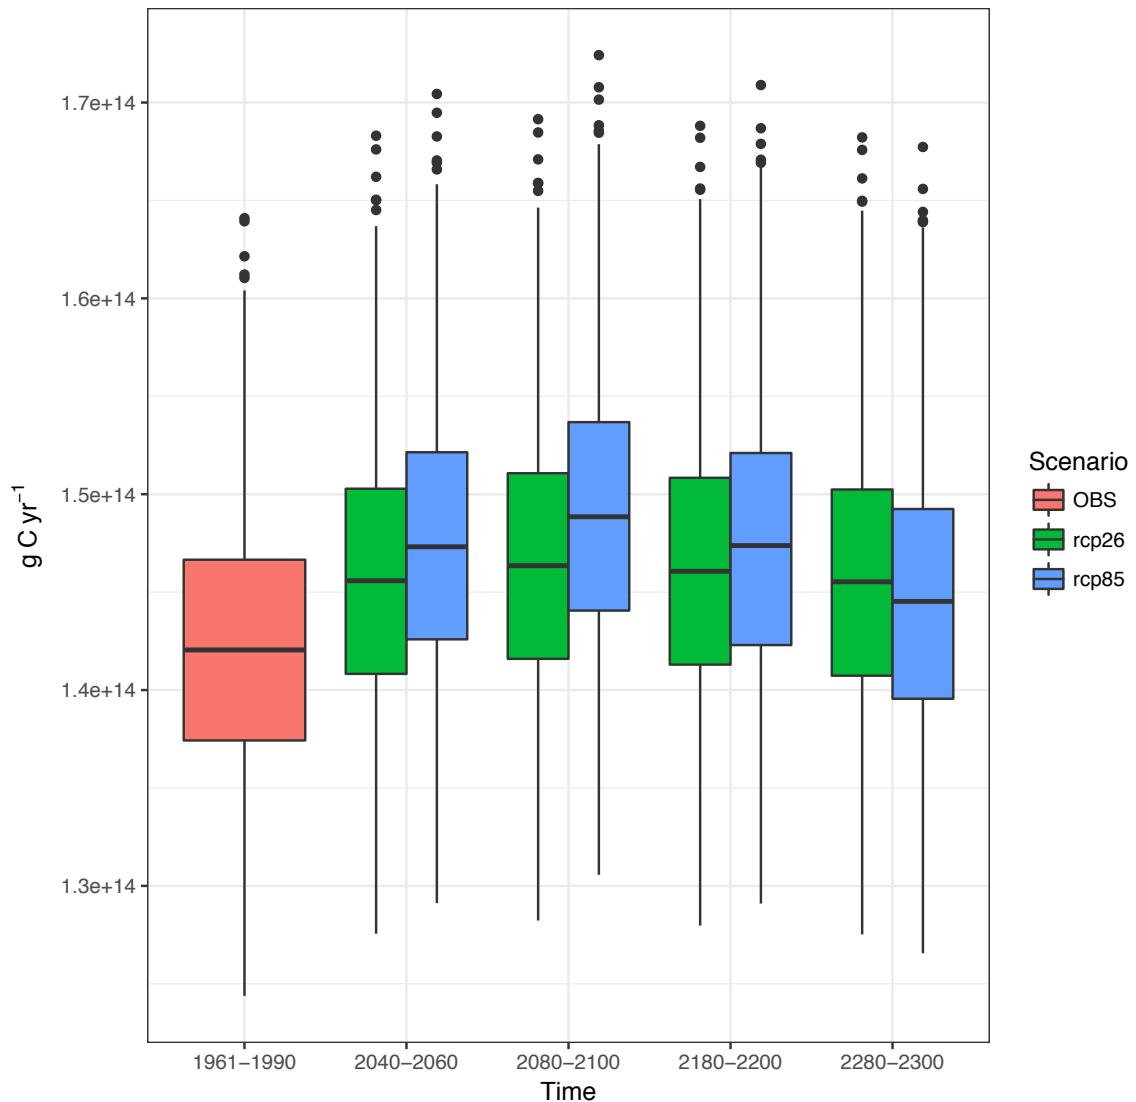

Figure SI3: Global historic value of the global peatland carbon sink (1961–1990, in red), and future trends of the global peatland carbon sink for time spans 2040–2060, 2080–2100, 2180–2200 and 2280–2300 and for two different representative concentration pathways: RCP26 (in green) and RCP85 (in blue)

Table SI3: Results of a Tukey post-hoc test or pairwise comparison of means on the differences in global peatland carbon accumulation between different periods for the two representative concentration pathways (RCP26 and RCP85). The columns show for each comparison: the difference in means, the 95% confidence interval (upper & lower limits) and an adjusted p-value.

RCP and period	Difference	Upper limit	Lower limit	p-adjusted
RCP26_2090-RCP26_2050	8.00 x10 ¹¹	1.31 x10 ⁹	1.60 x10 ¹²	4.94 x10 ⁻²
RCP26_2190-RCP26_2050	5.13 x10 ¹¹	-2.86 x10 ¹¹	1.31 x10 ¹²	3.50 x10 ⁻¹
RCP26_2290-RCP26_2050	-4.51 x10 ¹⁰	-8.44 x10 ¹¹	7.54 x10 ¹¹	9.99 x10 ⁻¹
RCP26_2190-RCP26_2090	-2.87 x10 ¹¹	-1.09 x10 ¹²	5.12 x10 ¹¹	7.92 x10 ⁻¹
RCP26_2290-RCP26_2090	-8.45 x10 ¹¹	-1.64 x10 ¹²	-4.65 x10 ¹⁰	3.32 x10 ⁻²
RCP26_2290-RCP26_2190	-5.58 x10 ¹¹	-1.36 x10 ¹²	2.41 x10 ¹¹	2.75 x10 ⁻¹
RCP85_2090-RCP85_2050	1.55 x10 ¹²	7.29 x10 ¹¹	2.37 x10 ¹²	7.45 x10 ⁻⁶
RCP85_2190-RCP85_2050	-7.67 x10 ¹⁰	-8.97 x10 ¹¹	7.43 x10 ¹¹	9.95 x10 ⁻¹
RCP85_2290-RCP85_2050	-2.90 x10 ¹²	-3.72 x10 ¹²	-2.08 x10 ¹²	2.49 x10 ⁻⁸
RCP85_2190-RCP85_2090	-1.63 x10 ¹²	-2.45 x10 ¹²	-8.06 x10 ¹¹	2.19 x10 ⁻⁶
RCP85_2290-RCP85_2090	-4.45 x10 ¹²	-5.27 x10 ¹²	-3.63 x10 ¹²	2.49 x10 ⁻⁸
RCP85_2290-RCP85_2190	-2.82 x10 ¹²	-3.64 x10 ¹²	-2.00 x10 ¹²	2.49 x10 ⁻⁸

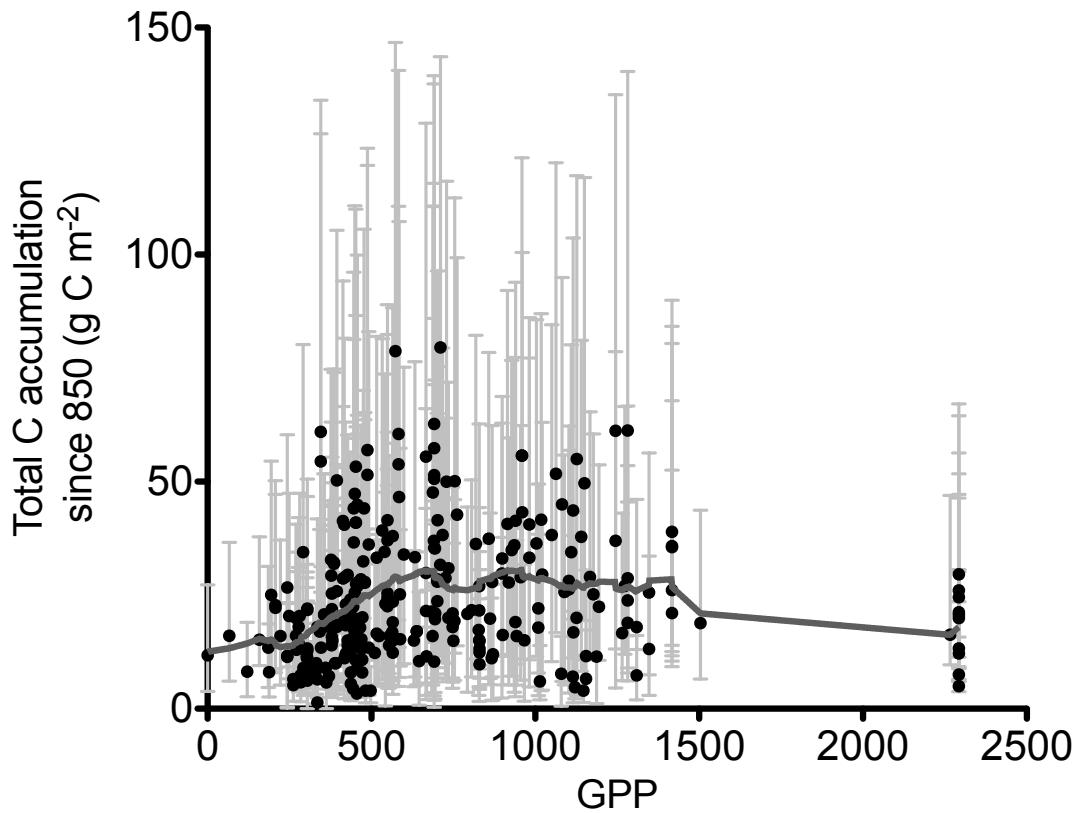

Figure SI4: Relationship between the total accumulation over the last millennium and gross primary productivity (GPP) values at each peatland site. The GPP values are derived from FLUXNET observations upscaled using a machine learning technique (MTE) (Jung et al, 2011).

Jung, M., et al. (2011), Global patterns of land-atmosphere fluxes of carbon dioxide, latent heat, and sensible heat derived from eddy covariance, satellite, and meteorological observations, J. Geophys. Res., 116, G00J07, doi:[10.1029/2010JG001566](https://doi.org/10.1029/2010JG001566).

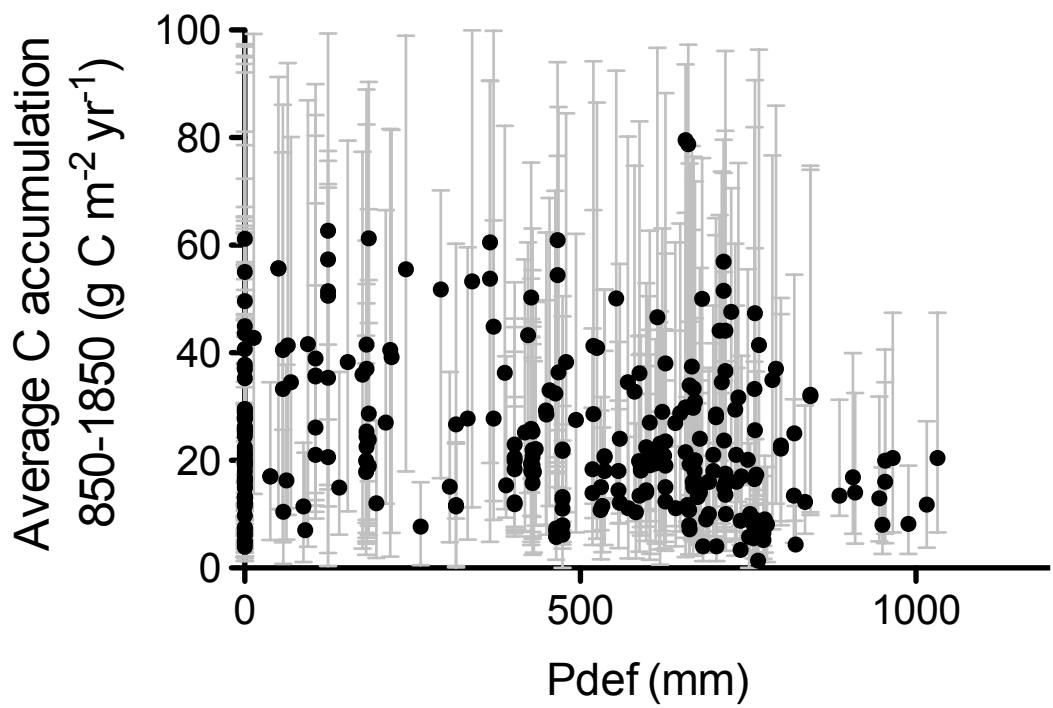

Figure SI5: The average yearly accumulation rate over the last millennium at each site compared to the precipitation deficit (Pdef) computed as the difference between the annual potential evapotranspiration and annual precipitation (PET-P) where PET-P cannot go below zero (if negative, it is set to zero).
