21 Keywords: antioxidants; cell signaling; heme oxygenase; hydrogen gas; hydrogen-  
22 rich water; hydrogen sulfide; nitric oxide; reactive oxygen species.

23  
24  
25 About the authors:

26 The corresponding author (JTH) has been researching the effects of reactive oxygen  
27 species, nitric oxide and other compounds which affect the redox of cells for thirty  
28 years. He is associate editor for PlosOne, Frontiers in Plant Sciences (Plant  
29 Physiology) and British Journal of Biomedical Sciences. He is the author of *Cell*  
30 *Signalling* (4<sup>th</sup> ed. 2016), Oxford University Press, which has been adopted by  
31 numerous universities around the world.

32 HRW is a Master's student who was an undergraduate at the University of the West  
33 of England, Bristol, under the tutelage of the corresponding author and DV. MW has  
34 had a long-standing research interest in reactive oxygen species, nitric oxide and  
35 hydrogen sulfide, with a focus on medical applications.

36

## 37 **Abstract**

38 Hydrogen gas (H<sub>2</sub>) was once thought to be inert in biological systems but it has now  
39 become apparent that exposure of a wide range of organisms, including animals and  
40 plants, to H<sub>2</sub> or hydrogen-rich water (HRW) has beneficial effects. It is involved in  
41 plant development, and alleviation of stress and illness, such as reperfusion injury.  
42 Here, an overview of how H<sub>2</sub> interacts with organisms is given.

43

## 44 **Introduction**

45 Molecular gaseous hydrogen (H<sub>2</sub>) was believed to be inert and non-functional in  
46 biological systems, including in mammals [1]. However, there now is a body of  
47 literature that suggests that exposure to H<sub>2</sub> has biological effects in a wide range of  
48 organisms [1,2]. In 1975 Dole et al. [3], using mice, suggested that H<sub>2</sub> could be used  
49 for a cancer therapy, whilst H<sub>2</sub> has been shown to relieve stress challenges in plants  
50 [2], and to be a protectant against radiation exposure [4]. However, the exact nature  
51 of the interaction of H<sub>2</sub> with biological systems is not well understood, and there is  
52 debate as to whether it has effects through cell signaling pathways.

53

## 54 **Exposure of Organisms to Molecular Hydrogen**

55 Although hydrogen gas is not abundant in the atmosphere cells can still be exposed  
56 to it. Organisms can produce H<sub>2</sub>, for example through the use of hydrogenases [5].  
57 In plants H<sub>2</sub> generation was increased addition of auxin [6] and by abscisic acid,  
58 ethylene, jasmonate, salt and drought, suggesting that it is important in stress

59 signaling [7]. It appears that H<sub>2</sub> is not endogenous in humans but exposure is likely  
60 caused through the action of colonic bacteria [4].

61 Exposure of organisms is more likely through exogenous means. Treatments with  
62 hydrogen gas, hydrogen-rich water (HRW) or hydrogen rich saline solutions (HRS)  
63 are now being advocated for a range of conditions and to alleviate stress responses  
64 [1]. Therefore the interactions of H<sub>2</sub> with cells will be important to understand.

65

### 66 **Is Hydrogen Gas Acting on Cell Signaling Mechanisms?**

67 The role of gases in cell signaling is not new, with abundant evidence that hydrogen  
68 sulfide and nitric oxide (NO) have biological effects [8]. If H<sub>2</sub> is acting as a signal it  
69 should: be made where and when it is needed, be able to move around, be  
70 recognized as being present, and be removed when it is no longer needed. As  
71 previously mentioned cells can be exposed to H<sub>2</sub> and since H<sub>2</sub> is small and inert it  
72 will be able to move through both soluble (eg cytoplasm) and hydrophobic  
73 (membranes) phases of the cell. It is harder, however, to envisage how it may be  
74 recognized as a signaling factor, by a receptor for example, since unlike many  
75 reactive signals, such as NO, it will not readily react with other cellular components,  
76 which could also lead to its removal. Therefore, its role in cell signaling is not easy to  
77 see.

78 One of the actions of H<sub>2</sub> has been reported to be through the modulation of  
79 antioxidant levels in cells. It is known that H<sub>2</sub> reacts with hydroxyl radicals and  
80 peroxynitrite, the latter known to have cell signaling roles. However H<sub>2</sub> does not  
81 appear to react with other reactive signaling molecules such as superoxide, NO or  
82 H<sub>2</sub>O<sub>2</sub>, and therefore seems to not directly affect their signaling actions [1], although

83 the closure of stomatal aperture by H<sub>2</sub> was shown to involve both reactive oxygen  
84 species and NO [9]. Effects on antioxidant levels have been reported [10,11] and  
85 these would affect signaling by H<sub>2</sub>O<sub>2</sub> and NO. Wu et al. [10] also showed that H<sub>2</sub>  
86 modulated levels of gene expression in plants, suggesting that signaling effects were  
87 evident, as reviewed by others [1].

88 A mechanism that has been reported is the modulation by H<sub>2</sub> of the heme  
89 oxygenase (HO) system. HRW treatment of mice up-regulated HO-1 expression [11].  
90 In cucumber HRW also increased the expression of HO-1 with concomitant  
91 increases in protein levels [12]. Root growth effects of HRW were sensitive to the  
92 HO-1 inhibitor zinc protoporphyrin IX (ZnPP) with the blocking effects being reversed  
93 by the presence of carbon monoxide (CO). Addition of the antioxidant ascorbic acid  
94 (AsA) failed to have an effect, suggesting that the HO system was key here.

95 Effects on other cell signaling mechanisms have also been reported. In mice HRW  
96 reduced levels of the intercellular signals TNF- $\alpha$ , IL-6, and IL-1 $\beta$ : this would lead to  
97 altered inflammatory responses. Intracellularly, the levels of endoplasmic reticulum  
98 stress proteins (p-eIF2 $\alpha$ , ATF4, XBP1s and CHOP) were reduced [11]. In a similar  
99 way, in plants it was found that H<sub>2</sub> influenced genes encoding hormone receptors,  
100 whilst endogenous H<sub>2</sub> production itself was induced by plant hormones [7].

101 Therefore it can be seen that H<sub>2</sub> has multiple ways to affect cellular function. Taking  
102 a generic approach, some of the influences of H<sub>2</sub> on cell activities are summarized in  
103 Figure 1.

104 Figure 1 here

105

## 106 Use of Hydrogen Gas to Modulate Cellular Activity

107 It is evident that in most cases treatments with H<sub>2</sub> gas or HRW have beneficial  
108 effects regardless of whether H<sub>2</sub> is acting as a cell signaling component, although Liu  
109 et al [13] reported that treatment of rice with HRW inhibited elongation of roots and  
110 shoots and decreased fitness parameters. On the other hand, it has been suggested  
111 to improve resistance of plants to a number of stresses including drought, salinity,  
112 cold and heavy metals [14]. Studies on cadmium toxicity in plants show that HRW  
113 reduces oxidative damage and lipid peroxidation, and hence bestows tolerance [2].  
114 Others report that plant growth may benefit from HRW treatments [12]. H<sub>2</sub> was  
115 involved in root formation [6] in a study where H<sub>2</sub> increased NO levels, implicating  
116 nitrate reductase-dependent NO generation. In a similar study, adventitious root  
117 development in cucumber under drought stress was promoted by treatment with  
118 HRW and it was suggested that another gas, CO, was involved [15]. Postharvest  
119 effects have also been reported [14,16], with some of the benefits being assigned to  
120 changes in antioxidant levels. This would certainly be a cleaner treatment than some  
121 of the alternatives, such as the use of hydrogen sulfide [17].

122 In animals, including humans, H<sub>2</sub> has been mooted to be of benefit [1]. It has been  
123 suggested to be a cancer therapy [3] and to protect against radiation damage [4]. It  
124 has also been shown to have beneficial effects in ischaemia-reperfusion injury and  
125 stroke, where reactive oxygen species and oxidative stress are known to be  
126 important [18]. Another target of HRW is inflammatory bowel disease [11] where it  
127 was protective against colon shortening and colonic wall thickening. One of the  
128 challenges of modern medicine is neurological disease; HRW may also help here.  
129 Symptoms are relieved by drinking HRW and it has been suggested that it may help  
130 patients with Parkinson's disease [19].

131

## 132 **Conclusion**

133 From being considered simply an inert gas there is now a body of evidence that  
134 suggests that the effects of hydrogen gas on a range of organisms is worthy of  
135 further investigation. It appears to impinge on cell signaling activities, even if it is  
136 unclear how it may do so. However, there is indicative evidence that treatments with  
137 H<sub>2</sub> gas or HRW may be beneficial for both animals and plants, with increased health  
138 and crop yields.
